

REMARKS

It is respectfully submitted that a person skilled in the art would not consider the right most point of item 54a' of Cheng to be a rolled edge when that term is construed within the context of the specification and drawings of the present application. However, in a spirit of conciliation and to advance prosecution of the present application, claim 1 has been amended to further define the present invention in a manner to distinguish over Cheng. It should be noted that Cheng suffers from the disadvantages of the prior art as set forth in the **Background of Invention** and, in particular, requiring solder and cutting users' fingers avoided by the present invention. Favorable reconsideration is respectfully requested.

Further, claims 5-7 have been added further defining the present invention in a manner to distinguish the present invention over Cheng. Thus, it is respectfully submitted that claims 5-7 are in condition for allowance for these separate and independent reasons. Favorable consideration is respectfully requested.

The Examiner has cited the United States patents listed in NOTICE OF REFERENCES CITED as C-F. By the lack of application of these references and others like them within the classes or subclasses searched, the Examiner apparently recognizes the clear patentability of the present invention over any of these references.

Therefore, since the claims of the present application have been shown to include limitations directed to the features of applicant's carrying apparatus which are neither shown, described, taught, nor alluded to in any of the references cited by the Examiner, whether those references are taken singly or in any combination, the Examiner is requested to allow claims 1-7, as amended, of the present application and to pass this application to issue.

Respectfully submitted,

Jen-Ren Yeh
